substituent on the alpha-carbon atom of the second amino acid from the V-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivals (e.g. gingivitis or periodontitis). The present amino acid sequence represents the C-terminal region of the Staphylococcus aureus V8 endopeptidase enzyme.
The DPP-7 target peptide has an aliphatic or aromatic residue as a

Prodn. of recombinant polypeptide(s) - using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide

Example 8; Fig 14a; 44pp; English

A fusion protein, VBD (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature VB protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli Omp7 protease to yield active VB protease. Extension of the C-terminal end of the VB moiety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of THE STATE OF THE S

The sequences given in AAR26842 and AAR29644 are proteases which were isolated from Staphylococcus aureus strains. The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel protease prepd. using Bacillus or Saccharomyces host capable of cleaving peptide bond at carboxyl terminus of glutamic acid residues in polypeptide(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length:

                                                                       RESULT
                                                                                                                          A fusion protein, VBD (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature VB protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli Ompt protease to yield active VB protease. Extension of the C-terminal end of the W moteaty of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prodn. of recombinant polypeptide(s) \cdot using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide

The constructs were inserted into vector p69784DhCT(G)R6, yielding pVBRPT(-) and pVBRPT(+), respectively. Both constructs yielded active protease when expressed in E. coli JM101 transformants.

sequence. The coding sequence was then used to generate mutants of the V8 protease which retain their levels of activity in the presence of a higher concentration of protein denaturant e.g. 5 M urea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which have enzyme activity even under environmental conditions which promote protein denaturation. The mutants are based on 3 truncated VB prodeases lacking 48 (AAW2218), 56 (AAW2219) or 53 (AAW22220) anino acids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, VMIS and/or R14YK. The protein sequence shown here represents a chimaeric protein comprising a truncated Staphylococcus aureus VB protease lacking the prepro and C-terminal 48 amino acids linked, via a synthetic linker, downstream of the E. coli beta-galactosidase. The S. aureus portion of the chimaera was amplified by the primers AAT73254-5 from wild type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new mutant Staphylococcus aureus V8 proteases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR91035
 The sequences given in AAR26842 and AAR29644 are proteases which were isolated from Staphylococcus aureus strains. The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.
                                                                                                                                                                                                                                                                                       Novel protease prepd. using Bacillus or Saccharomyces host - capable of cleaving peptide bond at carboxyl terminus of glutamic acid residues in polypeptide(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              125..392

Prodn. of recombinant polypeptide(s) - using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide
                                                                                                                                                                       Fusion proteins (AAR91033 and AAR91034) were constructed comprising an Escherichia coli beta-galactosidase derivative (protective polypeptide) fused at its C-terminal end to the S. aureus mauure V8 protease without or with the repeat region. The constructs were inserted into vector pG9784DhCT(G)R6, yielding pV8RPT(-) and pV8RPT(+), respectively. Both constructs yielded active protease when expressed in E. coli JM101 transformants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Linker peptide; V8 protease; Staphylococcus aureus; recombinant protein; fusion protein; beta-galactosidase; Escherichia coli; transposon Tn903; aminoglycoside 3'-phosphotransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthetic;

                                                Region
                                                                   Region
 Mutant; Staphylococcus aureus; V8 protease; enzyme; denaturation; primer; truncation; wild type; PCR; polymerase chain reaction; amplification; proteolytic activity; fusion protein; beta-galactosidase; urea.
                                                                                                                                                                                                                                                                                                             A fusion protein, VBD (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides (derived from Escherichia coli beta-galactosidase and and Tn903 aminodylvoside 3'-phosphotransferase, respectively), B is Staphylococcus aureus mature VB protease lacking the C-terminal repeat region, and L is a linker peptide (AAR91032). The fusion protein is expressed in inactive form in E. coli. It is then recovered, solubilised and cleaved at the linker peptide regions with a protease intrinsic to the host cells, i.e. OmpT protease, to allow recovery of VB protease.
                                                                                                                                                                                                                                                      Prodn. of recombinant polypeptide(s) – using host cells transformed with a gene coding for the desired polypeptide fused to a protective

The invention relates to new mutant Staphylococcus aureus VB proteases which have enzyme activity even under environmental conditions which promote protein denaturation. The mutants are based on 3 truncated VB proteases lacking 48 (AAM2218), 56 (AAM22219) or 53 (AAM22220) amino acids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, N71S and/or R147K. The protein sequence shown here represents a chimaeric protein comprising a truncated Staphylococcus aureus VB protease lacking the prepro and C-terminal 56 amino acids linked, via a synthetic R6 linker, downstream of the E. coli beta-galactosidase. Also included downstream of the VB protease fragment is a second R6 linker and a fragment of the aminoglucoside 3'-phosphotransferase protein. The chimaeric sequence was generated by restriction digestion and ligation from the VBRPT(-) sequence (see AAW22218) by using a natural EcoRV site which removed a further 8 amino acid from the C-terminus. This truncated VB protease, designated VBD, retains its level of activity in the presence of a higher concentration of protein denaturant e.g. 5 M urea.
                                                                                                                                                                                                                                /note="R6 linker sequence"

-:- FUNCTION: Satiety factor closely associated with the actions of leptin and neuropeptide y; this anorectic peptide inhibits both normal and starvation-induced feeding and completely blocks the feeding response induced by neuropeptide Y and requlated by leptin in the hypothalamus. It promotes neuronal development and survival
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Perrone L.; "Mutational screening of the CART gene in obese children: identifying

normal and starvation-induced feeding and completely blocks the feeding response induced by neuropeptide Y and regulated by leptin in the hypothalamus (By similarity).

SUBCELLULAR LOCATION: Secreted (Potential).

ALTERNATIVE PRODUCTS: 2 isoforms: a long form (shown here) and a short form; are produced by alternative splicing.

SIMILARITY: BELONGS TO THE CART FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE-20504483; PubMed-11016950; MEDLINE-20504483; PubMed-11016950; MeDLINE-20504483; PubMed-11016950; Medius H.D., Lasky S.R., Baliga N.S., Thorsson V., Sbrogna J., Swartzell S., Weir D., Hall J., Dahl T.A., Welti R., Goo Y.A., Leithauser B., Keller K., Cruz R., Danson M.J., Hough D.W., Maddocks D.G., Jablonski P.E., Krebs M.P., Angevine C.M., Dale H., Isenbarger T.A., Peck R.F., Pohlschroder M., Spudich J.L., Jung K.-H., Alam M., Freitas T., Hou S., Daniels C.J., Dennis P.P., Omer A.D., Ebhardt H., Lowe T.M., Liang P., Riley M., Hood L., DasSarma S.; Genome sequence of Halbbacterium species NRC-1.", Proc. --- CATALYTIC ACTIVITY: ATP + L.methionine + H(2)O = phosphate + diphosphate + S-adenosyl-L.methionine.

--- PATHWAY: Activated methyl cycle.
--- SIMILARITY: BELONGS TO THE ADOMET SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     'Saml, a new gene coding for S-adenosylmethionine synthetase in

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     óλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are artifacts associated with the generation of cDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcriptase errors that result in single base changes. For further information about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADKOPLQEVGFINSAADHLAEMAKPÖNVLMLRVSVDGVAKAHGEKSVAVEEANKLLSA
